

Engine Analyzer 'Plus' Features Supplement

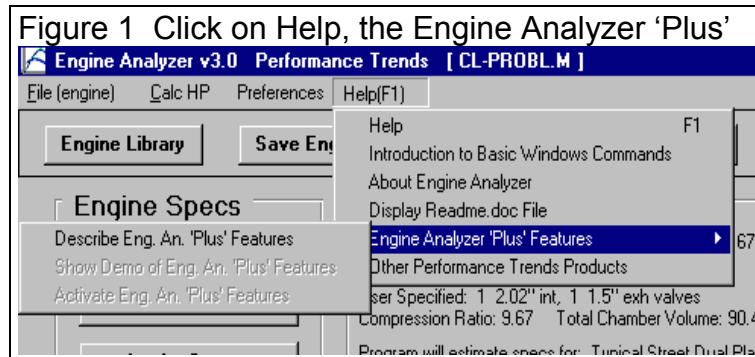

PERFORMANCE TRENDS, INC.

Check DISCLAIMER OF WARRANTIES and LIMITATION OF LIABILITY at the beginning of the main manual.

Engine Analyzer 'Plus' Features

The Engine Analyzer Plus is a package of features the owners of the standard Engine Analyzer can add to their program. This package can be added either at the time of the original purchase or after they have purchased a standard program. See Figure 1 for obtaining information, activating your 'Plus' version, or running a demo of the 'Plus' features.

Major Features:

- Calculate up to 20 RPMs.
- Calculate performance for alternate fuels like Diesel, propane or CNG (compressed natural gas).
- Estimate Piston-to-Valve Clearance.
- More graphing features.
- The 'Optimize' feature which lets you pick and modify most any engine specs and watch the effect on the torque and power curve right on the screen. This is great for quickly finding which specs have the most effect on your engine's performance.
- Use Full Flow Curve for cylinder head ports (New to Version 3.2)
- Use Millimeters (instead of inches) to enter engine dimensions (New to Version 3.2)
- Hide certain calculated output that you think is not important (New to Version 3.2)
- Choose different colors for graph lines, which can also effect the print quality when printing color graphs. (New to Version 3.2)
- Duration at .200" lift is displayed in the Cam Specs for the particular lobe you have specified. (New to Version 3.2)

Calculate More RPMs Alternate Fuels

These 2 features are available in the Running Conditions screen. There, you can increase 'Number of RPMs' to calculate up to 20 for more detailed power curves. See Figure 2.

There are also many additional 'Fuel Types':

1. Propane (lo-pres. gas) is a typical vapor propane system. If you specify a Carburetor in the Intake System specs, the program assumes you will use a venturi type of 'mixer', which usually has to be fairly small (restrictive with low CFM rating) to work correctly. If you specify an EFI system, the program assumes you are injecting propane vapor, which does not require the restrictive 'mixer'.
2. Propane (hi-pres. liquid 'LPG') is a special high pressure, liquid injection EFI system.

3. Natural gas (methane or CNG) is a typical vapor methane system. If you specify a Carburetor in the Intake System specs, the program assumes you will use a venturi type of 'mixer', which usually has to be fairly small (restrictive with low CFM rating) to work correctly. If you specify an EFI system, the program assumes you are injecting methane vapor, which does not require the restrictive 'mixer'.
4. Truck Diesel (prod w low smoke) is a typical production Diesel Truck, running from about 23:1 to 30:1 A/F (very lean) at full load to avoid smoke. A/F is assumed to lean out at higher RPMs.
5. Auto Diesel (prod w low smoke) is a typical production car Diesel, running about 20:1 A/F (very lean) at full load to avoid smoke.
6. Diesel (race rich w high smoke) is a rich Diesel run in tractor pulls, and other types of racing. The engine exhausts thick, black smoke running this rich but increases its power.
7. Diesel (rich hi-smoke race-pump) is a rich Diesel run in tractor pulls, and other types of racing. The engine exhausts thick, black smoke running this rich but increases its power. It also uses a special, "quick delivery" pump which shortens the injection time, speeding up combustion time. This pump allows the Diesel to run a higher than normal RPMs.

Estimate Piston-to-Valve Clearance

Figure 2 Plus Features in the Running Conditions Screen

You can now enter a number of up to 20 RPMs

The screenshot displays the 'Running Conditions' window with the following fields:

Test Conditions		Fuel Specs	
Weather	Use Conds Below	Type	Gasoline
Baro Pres, "Hg	29.9	Fuel Octane (R+M)/2	93
Intake Air Temp, deg F	80	RPMs to Run	
Dew Point, deg F	32	Starting RPM	600
Elevation, feet	0	Number of RPMs	10
Coolant Temp, deg F	190	RPM Increment	600
		RPM Preview: 600, 1200, 1800, 6000	

The callout box shows the expanded 'Fuel Type' dropdown menu with the following options:

- Gasoline
- Very rich alcohol (for blowers)
- Propane (lo-pres. gas)
- Propane (hi-pres. liquid 'LPG')
- Natural gas (methane or CNG)
- Truck Diesel (prod. lean w low smoke)
- Auto Diesel (prod. rich w low smoke)
- Diesel (race rich w high smoke)
- Diesel (rich hi-smoke race-pump)

Click on Fuel Type for a list of several additional fuel types.

This screen will estimate how close the valves get to the piston. Although this is NO substitute to checking piston clearance with clay, it will let you try different cam profiles, rod lengths, strokes, head designs, etc to see how piston-to-valve clearance is likely to change.

Assumptions:

- The program assumes a FLAT TOP piston. Clearances for domed pistons will be much tighter than shown here.
- The program assumes NO rod stretch and NO valve tossing or valve train bending. Therefore, clearances at high RPM are likely to be CLOSER than indicated here.

The clearances calculated are the closest the piston is to the valve, checked every 4 degrees of rotation. If the clearance is less than .100, the clearance is printed in red.

Negative (-) clearances mean the valve is extending into the piston that amount. For example, if clearance is -.048 and you want .100 clearance, you must notch the piston .148 inches.

Definitions of input dimensions:

Gasket Thickness: Thickness of head gasket torqued to spec.

Deck Ht Clearance:

Distance from piston top at TDC to block deck. If piston travels above the deck at TDC, enter a negative (-) number.

Valve angles: Largest angle between valve stem and line perpendicular (90 deg) to the deck surface. For 23 degree Chevy heads, this would be 23.

Deck/Valve

Clearance: Closest distance between edge of valve and the head surface. If the valve(s) extend beyond the head surface (ex. valve touches table top when head sits on table), enter a negative (-) number for the amount of distance the valve edge extends beyond the head surface. See Figure 3.

Click on Save Specs and these dimensions are saved with the engine file.

Examples of dimensions for some typical heads are shown in Table 1.

Table 1 Examples of Typical Head Specs

Head Description	Int Valve Dia	Exh Valve Dia	Int Valve Angle	Int Deck/Valve Clearance	Exh Valve Angle	Exh Deck/Valve Clearance
Stock SB Chevy 186, 492, etc	2.02	1.60	23	.01	23	.08
Brodix -8 SB Chevy	2.08	1.625	23	.10	23	.14
Merlin Cast Iron BB Chevy	2.19	1.88	27	.01	7	.55
Stock SB Ford 351 W	1.84	1.54	20	.08	20	.10
Stock Cleveland Ford 351 C	2.19	1.71	11	.13	11	.27
Stock Pontiac 400, 455, etc	2.11	1.77	14	.13	14	.20

IMPORTANT: These example specs may NOT exactly match your heads. Use with caution!

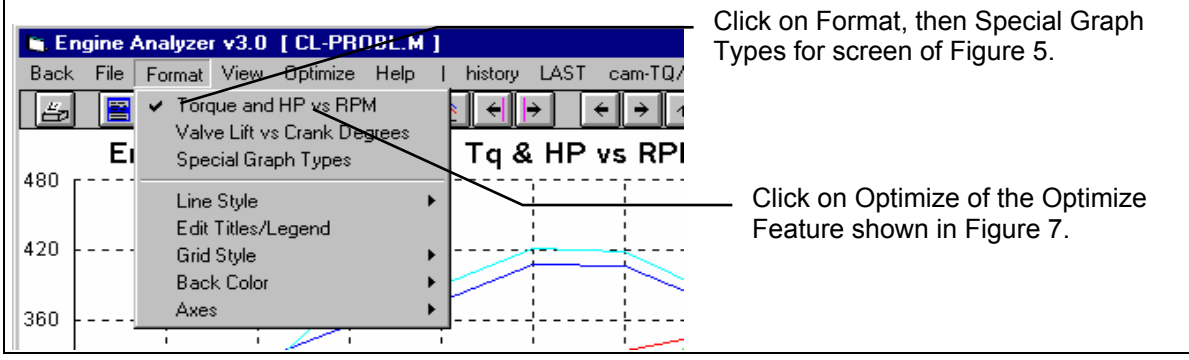

Graphing Features

The 'Plus' features add 2 powerful features to the Graph Screen, shown in Figure 4:

1. Click on 'Format', then 'Special Graph Types' for a menu to graph most any calculated output vs RPM, like BSFC, Spark Advance, etc.
2. Click on 'Optimize' to display several options at the bottom of the graph screen to modify most any engine specs and see the effect immediately on the torque and HP graph.

These options are not visible unless you have the 'Plus' version or are displaying the 'Plus' version demo. Click on Help at the Main Screen, then 'Engine Analyzer 'Plus' Features' to turn on the demo. See Figure 1.

Figure 4 Graphing Features

Special Graphs

This menu lets you graph up to 4 different types of data on the same graph, for example Torque, HP and Spark Advance vs RPM.

First, select 'RPM Data, Use Specs Below' as the Graph Type.

Then select the # of Data Types to include in the graph, from 1 to 4. The appropriate # of graph specs will now be enabled.

Now you can select from the Data Types available, Torque, HP, BSFC, etc.

Then select the 'Multiplier' for each data type. For example, BSFC only ranges from say .4 to .5 but torque and HP may range from 100 to 500. BSFC would only show as a straight line a 500 HP scale. However, if you multiply BSFC x 1000, BSFC would now range from 400 to 500 and show up clearly. Therefore, select large multipliers for small data values.

Figure 5 Special Graphs Menu

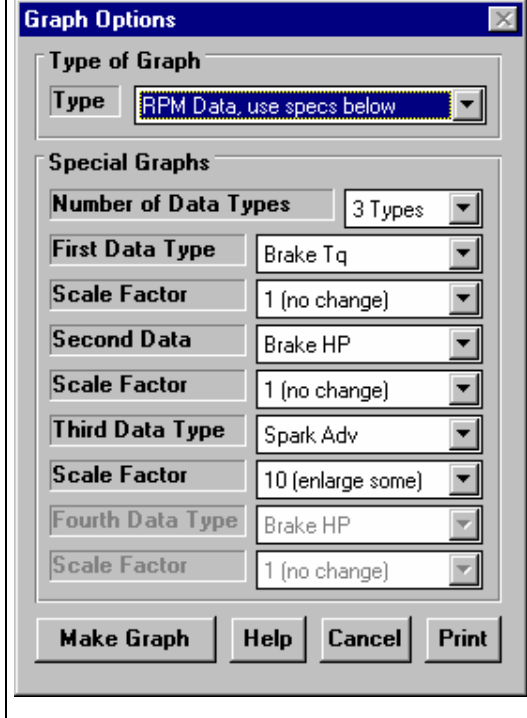

Figure 6 Special Graph Created from Specs of Figure 5

Legend shows Spark Advance is multiplied by 10 so it will show up on this scale also graphing torque and HP.

Optimize

The Optimize feature lets you modify most any engine specs and immediately see the effect on performance. See Figure 7.

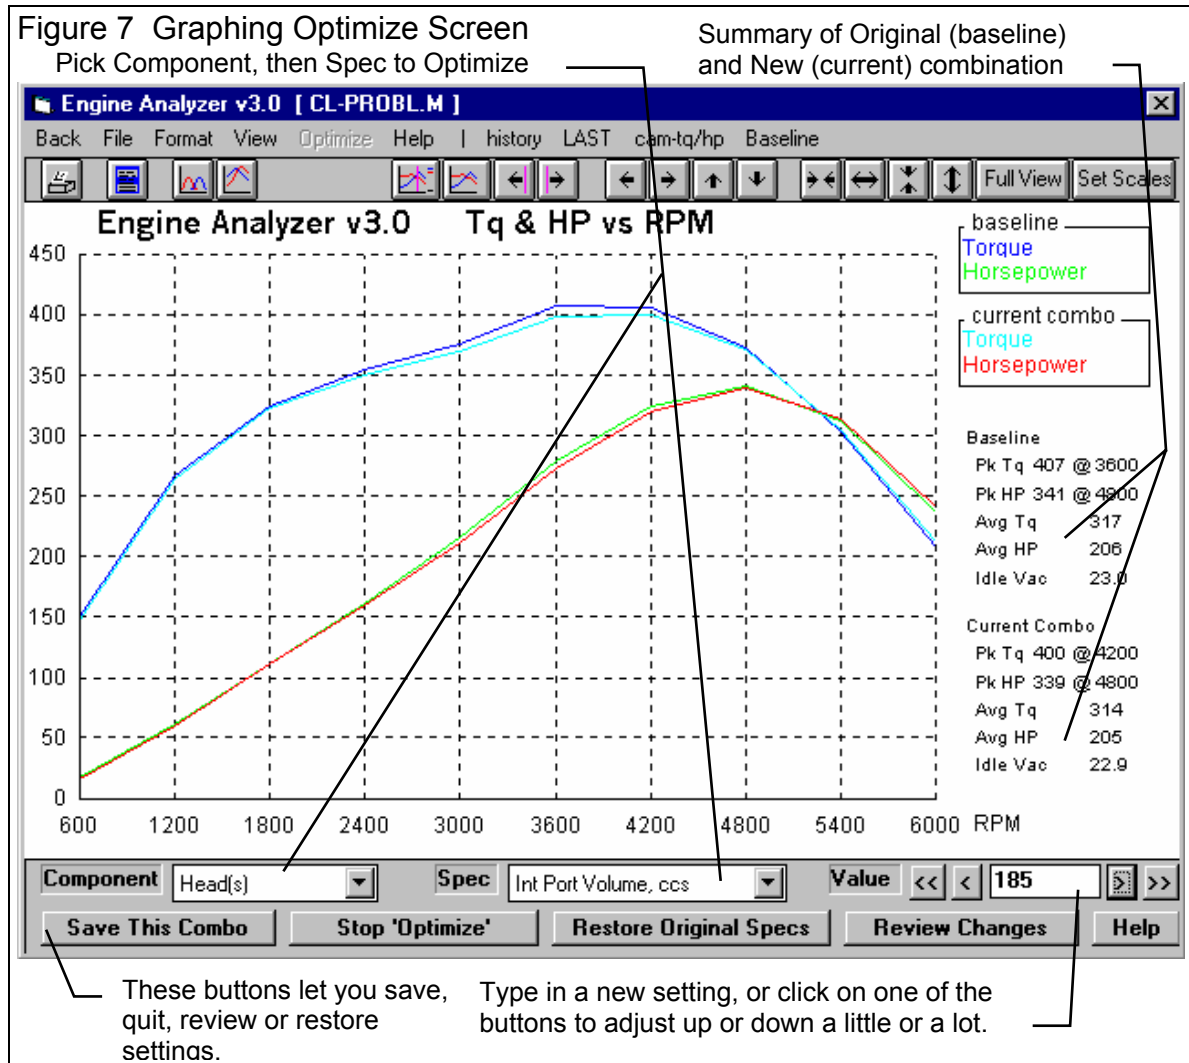

First, select the 'Component' you want to modify.

Then, select the 'Spec' for that Component.

Depending on the type of Spec you selected, you will have a list of settings, or a text box where you can type in a new setting. Each time you make a change to the setting, a new Torque and HP curve will be drawn so you can see the effect of this change.

The Optimize feature lets you modify just 1 spec or many specs for various components. For example, say you start by modifying Intake Cam Centerline from the original 110 deg to 104 degrees. Then you select to modify Intake Port Volume on the Head from the original 186 to 220 ccs.

Click on 'Save This Combo' to save any changes you have made to the Engine File you are working with. Note that you are not asked if you want to save to a New Name, meaning these changes overwrite the current specs for the current Engine File. Therefore, you may want to save your Engine to a New Name BEFORE you use the Optimize feature.

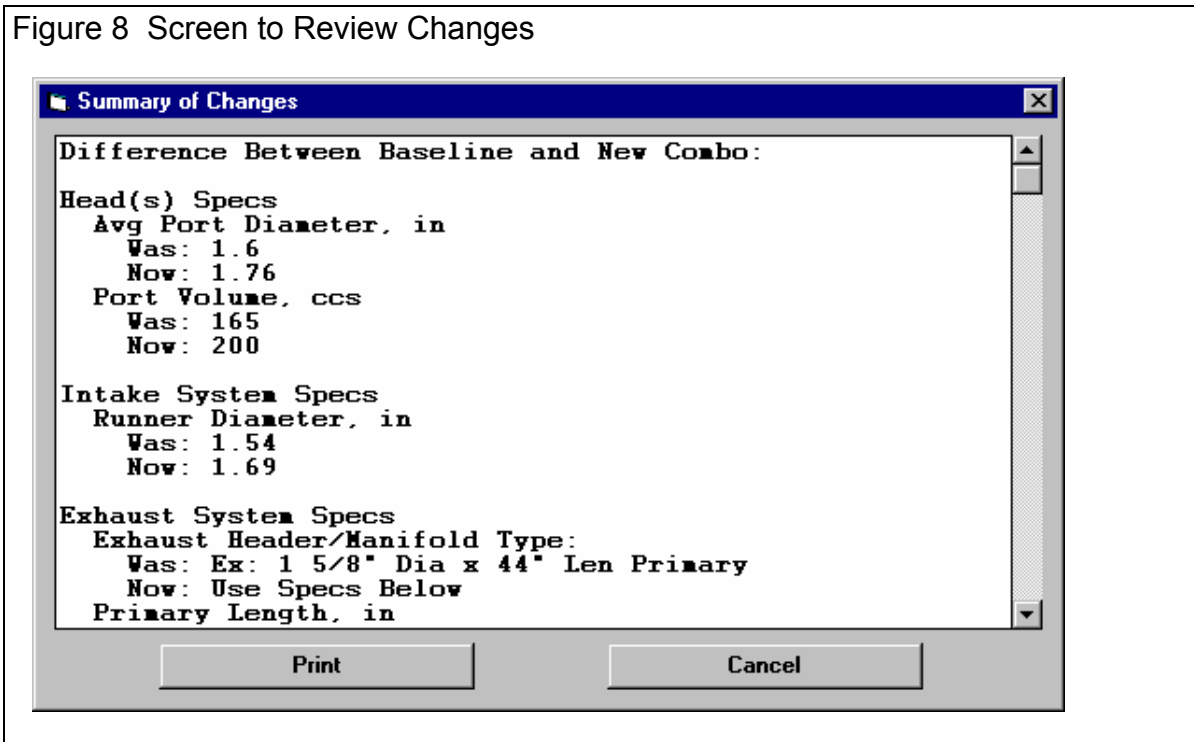

Click on 'Stop Optimize' to return to the normal graph screen and abandon any changes you have made.

Click on 'Restore Original Specs' to return all modified specs back to their original settings.

Click on 'Review Changes' and you will see a history of all changes you have made. Printing these changes is a convenient way to remember these changes. Then you can return to the Main Screen and make these changes and see the effects on other calculated output, like Spark Advance, or Exhaust Pressure, etc. See Figure 8.

Figure 8 Screen to Review Changes

New Plus Features in Version 3.2

Use Full Flow Curve or Flow Table

In the Head Specs menu, there is a check box to let you use the Avg Flow Efficiency for the port, or a Flow Table if you check the check box.

Figure 9 Flow Table Feature in Head Specs

The screenshot shows the 'Head(s)' software interface. The 'Intake' section is active, showing a 'Layout' of '1 valve & 1 port', a 'Valve Diameter, mm' of 50.93, an 'Avg Port Diameter, mm' of 47.24, a 'Port Volume, ccs' of 198, and a 'Port Length, mm' of 113.03. The 'Flow Efficiency, %' is checked, and the 'See Table' button is highlighted. A callout box points to the 'See Table' button with the text: "Click here to produce the 'See Table' button." Another callout box points to the 'See Table' button with the text: "Click on 'See Table' to display the table shown below." A third callout box points to the 'Calc Port Flow Table' window with the text: "The Avg Flow Efficiency is calculated from the 3 highest lift points you've entered, and is displayed for your information, so you have a sense of how good a port this is. You must enter at least 4 points before this is displayed. The program uses all points entered".

The 'Calc Port Flow Table' window shows the 'Avg Flow Efficiency, %' as 47.4. The 'Flow Data' section lists the following lift points:

Lift	Flow
Lift 1	45
Lift 2	80
Lift 3	105
Lift 4	120
Lift 5	125
Lift 6	127
Lift 7	
Lift 8	

The graph shows a curve of flow vs. lift, with the highest lift point being 127. The 'Note' section states: "Enter at least 4 valve lifts and flows for this port. 'Avg Flow Effcy' is based on only 3 highest lifts, and is shown just for info. Program uses full curve." The 'Sort Table', 'Clear All', and 'Clear CFMs' buttons are also visible.

Figure 10 Preferences for Plus Features

Choose what calculated data you do NOT want displayed or printed

Set desired Clearance for Piston-to-Valve calculation.

Choose if you want to use Millimeters for entering Engine Dimensions.

Set this to 'Yes' to have this screen define the graph colors.

Click here to get screen to right to pick which colors you want used for making graph lines.

User Specified Graph Colors

Line 41	10	Line 42	11
Line 43	12	Line 44	13
Line 45	14	Line 46	1
Line 47	2	Line 48	3

Use Millimeters

Figure 10 shows where you can select to use Millimeters to enter engine dimensions like Bore, Cam Lift, etc. Note that these dimensions are changed if a file was saved in inches and the Preference is now set to MM. If you switch back and forth between inches and MM, the actual measurements may change slightly due to this conversion and rounding errors.

Desired Piston-to-Valve Clearance

Figure 10 shows where you can select a Desired Piston-to-Valve Clearance from the drop-down list. Most engine builders use .100" clearance for the intake and exhaust, but you can select anything you want here. Because you can now select a clearance, the calculation menu for Piston-to-Valve Clearance is now different than in the earlier v3.0.

Hide Output

Some users have requested that certain output be eliminated, that it can add to confusion to customers reading the output. Figure 10 shows where you can now select which outputs are not displayed or printed.

Choose Different Graph Colors

Figure 10 also shows how you can select each color for each graph line. For example, if Yellow does not show up well on your printer, you can change each occurrence of yellow to, say pink. This screen also lets you change the background color.

New Plus Features in Version 3.4

The Plus version now has over 20 added features compared to the Standard Engine Analyzer. Here's what we've added in v3.4 to the 10 Plus features in v3.2.

1. We've added the ability to import flow files from Port Flow Analyzer. Fig 11 and Fig 12.
2. We've added a new screen to let you do Variable Cam Timing (VVT). Fig 13.
3. Dwell over Nose (Cheater profile) can now be more exactly defined, to the nearest 2 degree increment. Fig 14.
4. Also, now this setting (Dwell over Nose) can be different on the intake vs the exhaust. Fig 14.
5. The program now allows for using a Ramp Rating for the cam profile for more exact cam profiles. Fig 14 and 15.
6. There is also a 'Clc' screen to calculate the ramp rating to match certain duration specs at either .200 lift or seat timing. Fig 14 and 15.
7. Program now has Fuel Option of E85. Fig 16.
8. We've added an option to include the Special Calculations section for writing ASCII files of test results. Fig 17.
9. Program now has an "Edit Printed Graph" command under Format. It opens a screen where you have several options on how to print your graph, include various comments, etc. You can now select to include the torque and HP data in a table when you print out RPM data graphs as long as there are torque and/or HP data on the graph. Fig 18 and 19.
10. You can now print a Company Logo graphics files on reports and graphs. This info is loaded in the Preferences screen. Fig 19 and 20.
11. You can specify 2 lines of text which can appear at the top of printouts of reports and graphs in the Preferences screen, under Printing/Graphing. Fig 19 and 20.

Figure 11 New Feature for Picking Example Component Files

The 'Head(s)' dialog box is divided into several sections. On the left, the 'General Specs' section includes a 'Notes' text area, a 'Type' dropdown set to 'Use Specs in this Menu', a 'Chamber' dropdown set to 'Typical Wedge', and a 'Compression Ratio' field set to 8.5. Below this is a 'Help' section with instructions. On the right, the 'Intake' and 'Exhaust' sections each have a 'Layout' dropdown set to '1 valve & 1 port', a 'Valve Diameter, in' field, and a 'Flow Efficiency, %' checkbox. The 'Intake' section also includes 'Avg Port Diameter, in' and 'Port Volume, ccs' fields. At the bottom, there are buttons for 'OK', 'Help', 'Get Example', 'Save Example', and 'Print'. A callout box with a black border and white background points to the 'Get Example' button, containing the text: 'Click on Get Example button in the Head Specs screen to bring up the screen below for importing a Head Flow File from out Port Flow Analyzer.'

The 'Categories of Cylinder Head Examples for Picking' dialog box features two main list boxes. The left list, titled 'Categories (groups) of Performance Trends' Examples', contains items such as 'Typ Small 2 Valve Heads', 'Typ Small 4 Valve Heads', 'Typ Small Flatheads', 'Typ Large 2 Valve Heads', 'Typ Large 4 Valve Heads', 'Typ Large Flatheads', 'Small Block Chevrolet', 'Big Block Chevrolet', 'Mopar (Chrysler)', 'Small Block Ford', 'Other Ford', 'Other Domestic', 'Imports', 'Motorcycles', and 'Karts'. The right list, titled 'Categories (groups) of Examples Added by User', currently contains the name 'kevin'. Below the lists are buttons for 'Use Category' and 'Cancel'. A 'New Category Name' text field is positioned above a set of buttons: 'Add New Category Name to List', 'Rename Chosen Category', and 'Delete Chosen Category'. At the bottom, there are two large buttons: 'Load Files from Other Company's Programs' and 'Load Files from Port Flow Analyzer'. A callout box with a black border and white background points to the 'Use Category' button, containing the text: 'Click on this button to bring up the screens shown in Figure 12.' A tip at the bottom left reads: 'Tip: Click on a category in either section to highlight it, then click on the 'Use Category' button, or just Double Click on the category to pick in one step. (Categories are groups of examples, like a group of Chevy heads, not individual examples.)' See page 118 in manual for details.'
